Data formatting The programming language AutoLISP was popularly used for formatting data, which could be exported to AutoCAD drawings, allowing for automation. AutoCAD introduced its own data formatting language, implemented using AutoLISP, in AutoCAD 2011. This "AutoCAD data language" uses meta-objects to represent block elements, such as lines, arcs, splines, and text. It features static and dynamic formatting that can be applied to blocks. Dynamic formatting can be used to generate a wide variety of data, including fixed-layout reports, fixed-style charts, and tables. Formatting using the DXF data format is also possible. Data integration The native format for importing and exporting in AutoCAD is the DXF, which was introduced in AutoCAD 2015. Since its implementation DXF has remained the same and has been used for the interchange of drawing information. In AutoCAD 2016, DXF was also used to exchange G-code, a representation of all the machine control features of a CNC machine tool, but this has since been discontinued. In AutoCAD 2017, the file format was extended to support XML files. This feature has enabled integration with other 3D packages including Inventor, Rhino, Revit, and Revit Architecture, and allows the use of other graphical, engineering and architectural packages, such as SolidWorks, Blender, and Grasshopper. DXF was also improved and has been used to import and export to some vector formats such as SVG. Vector graphics AutoCAD supports a number of vector graphics formats and they are supported in AutoCAD 2010 and later. The formats that are supported by AutoCAD are: DWG, a vector-based exchange format DXF, an exchange format for converting between other formats PDF, a paper format for printing and for use with Acrobat Reader and other PDF-compatible programs W3C SVG AutoCAD's native vector graphics support features are built upon PostScript Level 2 (PSL2), which is a supported PDF-Acrobat format. This allows many other vector graphics applications, such as Illustrator, to export to AutoCAD. Also, PDF is recognized as a standard format by most other programs. AutoCAD supports the specification of layers, which allows a user to create a graphic using various layers, which can be merged, printed, emailed a1d647c40b
