## What's New in the WAMP WWW Root Switcher?

This program is actually two parts in one. The two components are "Root Switcher" and "WWW Directory Mapper". Root Switcher is a GUI based program that allows you to define and "swap" the root directory location of your WAMP development environment. It is however merely a front-end for an entirely command-line-based WWW Directory Mapper program. WWW Directory Mapper in turn allows you to map the WWW directory of your WAMP development environment to a different directory. To do this you only need to specify the root directory location and a WWW directory to map to. The WWW Directory Mapper is not just for changing the root directory of your local WAMP development environment. You can use it to change the directory that any particular directory of your local development environment is mapped to. WWW Directory Mapper is a command-line program that must be run from the command-line. There are two ways to start it: either from the command-line or from the "Root Switcher" GUI window. When run from the command line, WWW Directory Mapper will automatically provide you with a list of all the virtual host directories that are configured in your local WAMP development environment. Using this list, you can then easily "map" any WWW directory that you want. You can select from "Currently Mapping to" (CMD+A) or "Previously Mapped to" (CMD+P). When the program is run from the "Root Switcher" GUI, it will map the root directory location of your WAMP development environment to your current working directory. This is done by a click on the "Map Root Directory" button. A click on any of the options within the WWW Directory Mapper window will completely alter the WWW directory mapping by replacing it with the specific option. Using the command line, you can select from "Host Name", "WWW Directory", and "Virtual Server Name". For more information on the configuration options, have a look at the options menu. Configurations: --- Options --- Configure httpd.conf Settings: - Root Switcher configures your httpd.conf file if it does not already exist in the default location for WAMP development environment configuration. - wamp.ini does not exist in the default location for WAMP development environment configuration. - wampwacfg does not exist in the default location for WAMP development environment configuration.
