Conventional rivet crimping and sizing devices comprise a plunger, a crimping rod, a crimping sleeve and a crimping element. A crimping tip is rotatably mounted in a front end of the crimping rod. A crimping tip is removably fitted on a crimping element to form a series of crimping tips, whereby a series of crimping elements are assembled together. One end of the crimping rod is movably connected with the plunger and the crimping rod is driven to move toward the crimping element to compress and seal the rivet. At the same time, a rivet sleeve is pressed and retained in the crimping sleeve, such that the rivet is crimped. The crimping element comprises a first crimping tip, a second crimping tip and a crimping sleeve. A through hole is formed through a center of the crimping sleeve, through which the crimping sleeve is fitted with a crimping bolt. A first crimping tip is formed at a front end of the crimping sleeve, while a second crimping tip is formed at a rear end of the crimping sleeve. The first crimping tip can be held by the crimping bolt and the crimping sleeve, such that the first crimping tip is pressed to a first position and moved toward the crimping bolt by the crimping bolt. The second crimping tip can be pressed and moved toward the crimping bolt and rotated to move along the crimping bolt. The second crimping tip can ca3bfb1094
