Chinese pirate software In China, pirate software has been on the rise for a long time. It has gotten really big in the past few years, as the Chinese economy has flourished, and in order to benefit from the growing demand for software, several companies have started to enter the market. However, it's not only Chinese startups that have come to the market but also some western companies are looking to China as an expanding market. For China it is important to know that since the economy is still growing, they have plenty of unemployed workers, and with a growing economy it's expected that the upcoming years will see the total population jump to 380 million people, from the current 1.3 billion, so with this growth comes a need for software. Pirate software is software that has been modified so that it doesn't legally fall under the strict copyright laws of most countries. Downloading pirated software can be done in a few different ways. The most common method is downloading it through a P2P network. A P2P network is a network that allows people to swap software by sharing it in a similar way that sharing copyrighted movies, music and other forms of media is done today. Another method that is a bit more covert, and is also used by many pirate software groups, is to put pirated software on a physical disc. A disk is a piece of hardware similar to a CD-Rom or DVD that store a copy of the software on it. If you have a pirated copy of software on a disk you can make that disk into a portable copy of the software. Pirate software is mainly free software, but there are also commercial versions of software that can be found in various groups and markets. As mentioned before, since the economy is still growing in China, and piracy is free, it is expected that in the next few years the market will grow at a much quicker rate than the official market. This will create a window of opportunity for western software companies to enter the Chinese market, something that a few have already started to do. Both free and paid software can be found in China today. Free software is available in a few different ways. Some of them require registering on a Chinese website, however, there are also free websites that have been set up to take download requests from users. There are a few different types of software available, for example, you can find programs that have already been written that can be downloaded and installed, or you can find programs that are only available on a CD-Rom.
